

AI-Powered Log Analysis

& Incident Triage System

An intelligent system for faster incident detection and diagnosis

Software Engineering Internal Assessment

2. Motivation

Growing Log Volume

Modern applications continuously generate large amounts of logs.

Faster Response

Incidents need to be understood and prioritized quickly.

Smarter Monitoring

AI can turn raw logs into useful, human-readable insights.

Our Motivation

Reduce the time and effort required to understand system failures.

3. Problem Statement

Large volumes of logs make manual analysis slow and difficult.

Important errors can get buried among routine messages.

Related failures may be spread across multiple services.

Identifying the root cause during an incident can take significant time.

4. Proposed Solution

A centralized dashboard to collect and analyze application logs.

AI classifies error severity and summarizes important incidents.

Anomaly detection identifies unusual system behavior.

AI generates Root Cause Analysis (RCA) and recommended actions.

Logs → AI/ML Analysis → Incident Detection → RCA → Dashboard
